

## AdPower Road Test Method

Nov 2015

Tomizawa & Co., Ltd

### Test Method

- Prepare the several test automobiles (at least three, over five better)
- Fixed mileage: Run two trips in same distance, route, load and speed (best by cruise control) with full tank refilled. First trip runs without AdPower and second trip runs with AdPower. Compare mileage, time (speed) and fuel consumed for both trips.
- Reminders: 1. Top up the tank, to almost splitting out. (Total 3 times)  
2. Use fuel consumption meter
- Best apply cruise control for speed control.
- Warm up the engine, test within same day.
- Start and end at same fuel station. Refill best by same gun.
- Route would be at least in 100 kilometers per trip, best in smooth traffic.
- Night time and highway will be good choice to avoid traffic jam.
- Try not to stop for toilet or food during test of each trip.
- Test at least three times above process.
- Calculate every tests of the average and you will make a judgement of the result

\* We concluded from our experience that the engine is like human body and the engine have like biorhythm. Same car, same professional driver, same conditions, but the results are diversified. Hence we recommend to do test by several automobiles and several times.
